AMENDMENTS TO THE SPECIFICATION

Please amend the specification as follows:

Please amend paragraph [0019] as follows:

FIGURE 2 depicts a process 100 starting at 102 for implementing an embodiment of the present invention, for example, in software within a microprocessor or micro-controller device. At 106, digital content is retrieved or received from a source of such content (e.g., a cable system, a satellite system, or a storage device such as a disk drive or memory). The content is analyzed at 110 to determine if an OSD bitmap image is to be displayed which exceeds a threshold in size. If not, the OSD data is transmitted to the DTV over the IEEE1394 bus using ~~using~~ the EIA 775a protocol and are mixed with the decoded MPEG video ~~video~~ in the DTV prior to being presented to the display. Control then returns to 106 to retrieve or receive the next segment of digital content.

Application No.: 10/067,036
